01 / THE PRODUCT BET

A working connection. A blocked launch.

Charter turns scattered OAuth requirements into a contextual launch plan for a developer and their coding agent.

Open the prototype ↗ | Source + README ↗

THE JOB TO BE DONE

"I need customers to connect this app. Tell me what I can build now, what could delay launch, and who must act next."

Primary user: a developer shipping a customer-facing integration with an AI coding agent. This is a source-informed problem hypothesis; no user interviews or measured time savings are claimed.

WHAT EXISTING PRODUCTS TAUGHT US

Composio	Managed OAuth can remove app-registration work. First check whether a developer-owned app is needed.
Nango	Review guidance demonstrates why authentication setup and approval work need separate treatment.
Airbyte	AI-assisted connector configuration shows the value of converting documentation into implementation context.

THE COMPOSIO TOOLKITS LENS

Use managed OAuth where it fits. When an OAuth-capable toolkit needs a developer-owned app, Charter explains the registration and launch path.

Charter implements the developer-owned guidance path. Automatic managed-vs-custom routing is a next step, not a shipped feature.

Product bet: make the next decision clear, preserve the evidence, and let the same context travel into the coding workflow.

02 / THE DECISION IN THE PROTOTYPE

One scope choice. A different launch path.

Example: Gmail for external customers. A single generic OAuth checklist would hide a consequential product decision.

LIVE GUIDE EXCERPTS / EXTERNAL AUDIENCE

Send email only

gmail.send

VERIFICATION

Sensitive-scope review

SECURITY ASSESSMENT

Not triggered by this scope alone.

EXTERNAL WAITING

Published review estimates differ.

Read a mailbox

gmail.readonly

VERIFICATION

Restricted-scope review

SECURITY ASSESSMENT

Conditional on data flow and exemptions.

EXTERNAL WAITING

Several weeks may be needed.

Open this scenario ↗

Requirements remain conditional on the complete app and current policy. Excerpts are reconstructed from live guide data, not browser screenshots.

Why these three examples?

GitHub	User consent does not clear organization restrictions.
Gmail	Feature scope can change the verification and assessment path.
Slack	An early-customer pilot differs from commercial distribution.

FOLLOW THE SAME PLAN

Audience, capability and stage shape the guide. Expand a gate to inspect the reason, open the launch plan for ordered steps, then switch to Agent for the same record.

Open Gmail in Agent mode Fetch its actual .md

03 / THE AGENT AND THE HANDOFF

Research the unknown. Keep ownership explicit.

An unfamiliar provider triggers bounded document retrieval and Gemini synthesis. Schema, source-reference and dependency checks run before a guide is saved.

Discover — **Read** — **Synthesize** — **Validate** — **Save**

ACTUAL SAVED RESULT / LINEAR

3 sources. About 44 seconds. Partial.

A real model run generated and persisted a guide beyond the three reviewed examples. Provider review, customer-admin and marketplace requirements remained unresolved.

EXTERNAL WAIT

End-to-end wait not established

Open saved guide Inspect job + evidence

Learning: the original "None documented" label could imply zero wait. A versioned policy correction now preserves the original estimate while marking the overall wait unknown whenever a launch gate is unknown.

One guide. Two ways to work.

Human: next action, gates, ordered steps and sources.
Agent: the same scenario, ownership, dependencies and unknowns in Markdown, JSON or four MCP tools.

Raw Linear Markdown JSON guide MCP discovery

Charter agent	Find and read public docs, synthesize, validate and save.
Developer + coding agent	Select exact scopes; implement and test. The account owner handles credentials and console actions.
Provider / customer admin	Decide review and organization-access requests. Charter cannot approve these gates.

04 / EVIDENCE, TRADE-OFFS AND NEXT VALIDATION

What the prototype proves. What still needs evidence.

3	15/15	8
Reviewed examples	**Public contract checks**	**Waiting-policy checks**
GitHub, Gmail, Slack	Including saved-guide parity	Including historical corrections

Findings that changed the product

Scope is a product decision. Gmail send-only and mailbox reading have different classifications. The guide makes the capability choice visible.

Approval has several owners. GitHub organization restrictions and Slack distribution rules require separate gates, rather than a single "approved" state.

Absence is not an estimate. The Linear waiting-label issue produced a conservative rule for new output and an explicit policy revision for older saved views.

SCOPE AND TRADE-OFFS

Shipped guidance, live research, sharing and agent access. Deferred tracking: provider-status access was not established, and manual updates would create a separate workflow. Expand through a reusable schema and reviewed batches, not 100 unverified articles.

THE NEXT PRODUCT TEST

Watch five developers investigate unfamiliar providers with and without Charter. Use a counterbalanced task order. Measure **time to a correct next action**, consequential factual errors and lost assumptions during agent handoff. Establish a baseline before setting improvement targets.

BOUNDARIES

Documentation and software checks are not user validation. No interviews, provider registration, token exchange or approval submission were completed. The registration URL was fetched, but its authenticated form was not inspected. One model run succeeded; a later recheck returned Gemini 503 (high demand). Saved results remain available. Current browser capture is unavailable.
